

Oracle Integration using Oracle Fusion Middleware, SOA and BPEL for fast paced commodity trading engine

Background

Triple Point is a worldwide leader in multi-market commodities and enterprise risk management software solutions. Triple Point's product offering to its customers is "Commodity XL" (CXL) a commodity trading engine for the CPG market. Triple Point uses Oracle's eBusiness Suite to manage customers, purchase orders, payables, and general ledger.

Triple Point provides business intelligence to its customers to lock in supplier prices as market conditions change. Triple Point came to Estuate to connect their back-end business systems with CXL.

The Opportunity

Connect the proprietary CXL software and Oracle E-Business Suite in a short time frame with no loss of existing data or on-going transactions. Integrate the workflow from eBusiness "buy requisitions" to CXL contracts and on to purchase orders and final payments.

The Estuate Solution

Oracle Fusion middleware was used because of its built-in Oracle integration, connection flexibility to proprietary data structures and applications, and SOA support, offering Triple Point the future flexibility they required. The final integration was Oracle certified, benefiting Triple Point and its customers with accurate and easily accessible business intelligence.

Business Impact

- Estuate demonstrated its ability to implement and deploy a major Fusion/SOA based integration on time and in-budget.
- Triple Point's commodity management software and Oracle's E-Business Suite were integrated to create an automated fast, system available to all commodity classes served by Triple Point CXL.
